- Sponsor Department:

Margarita Vasquez, M.D. – Associate Professor, Department of Neonatology

AIM Statement

The aim of this project is to implement an oxygen targeting protocol for all patients in the NICU receiving supplemental oxygen with a goal of 50% compliance within 60 days of implementation.

The process begins when a patient who requires oxygen therapy is admitted to the unit and ends when patient no longer requires oxygen therapy. It is important to implement this protocol in order to improve long-term outcomes of NICU patients, specifically retinopathy of prematurity.

Project Milestones

- Team Created September 2015
- AIM statement created January 2016
- Weekly Team Meetings January 27 - present
- Background Data, Brainstorm Sessions, Workflow and Fishbone Analyses September 2015 – February 2016
- Interventions Implemented March 1– March 25 2016
- Data Analysis January 8 - present
- CS&E Presentation June 3, 2016

Background

- **Retinopathy of prematurity (ROP)** is a potentially blinding eye disorder that primarily affects premature infants weighing 1250 grams or less that are born before 31 weeks of gestation
- This disorder is one of the most common causes of visual loss in childhood and can lead to lifelong vision impairment and blindness. ROP was first diagnosed in 1942.
- There are approximately 3.9 million infants born in the U.S. each year; of those, about 28,000 weigh 1250 pounds or less.
- About 14,000–16,000 of these infants are affected by some degree of ROP. About 1,100–1,500 infants annually develop ROP that is severe enough to require medical treatment. About **400–600 infants each year in the US become legally blind from ROP.**
- Several complex factors may be responsible for the development of ROP. The two major risk factors of ROP are the use of **oxygen** and a decreased gestation period.
- Excessive oxygen contributes to ROP through regulation of vascular endothelial growth factor (VEGF).
- The NICU at UH has a high rate of infants who develop severe ROP and require treatment. A protocol to maintain spO2 saturations within an specific range to **prevent hyperoxia** did not exist.

Background

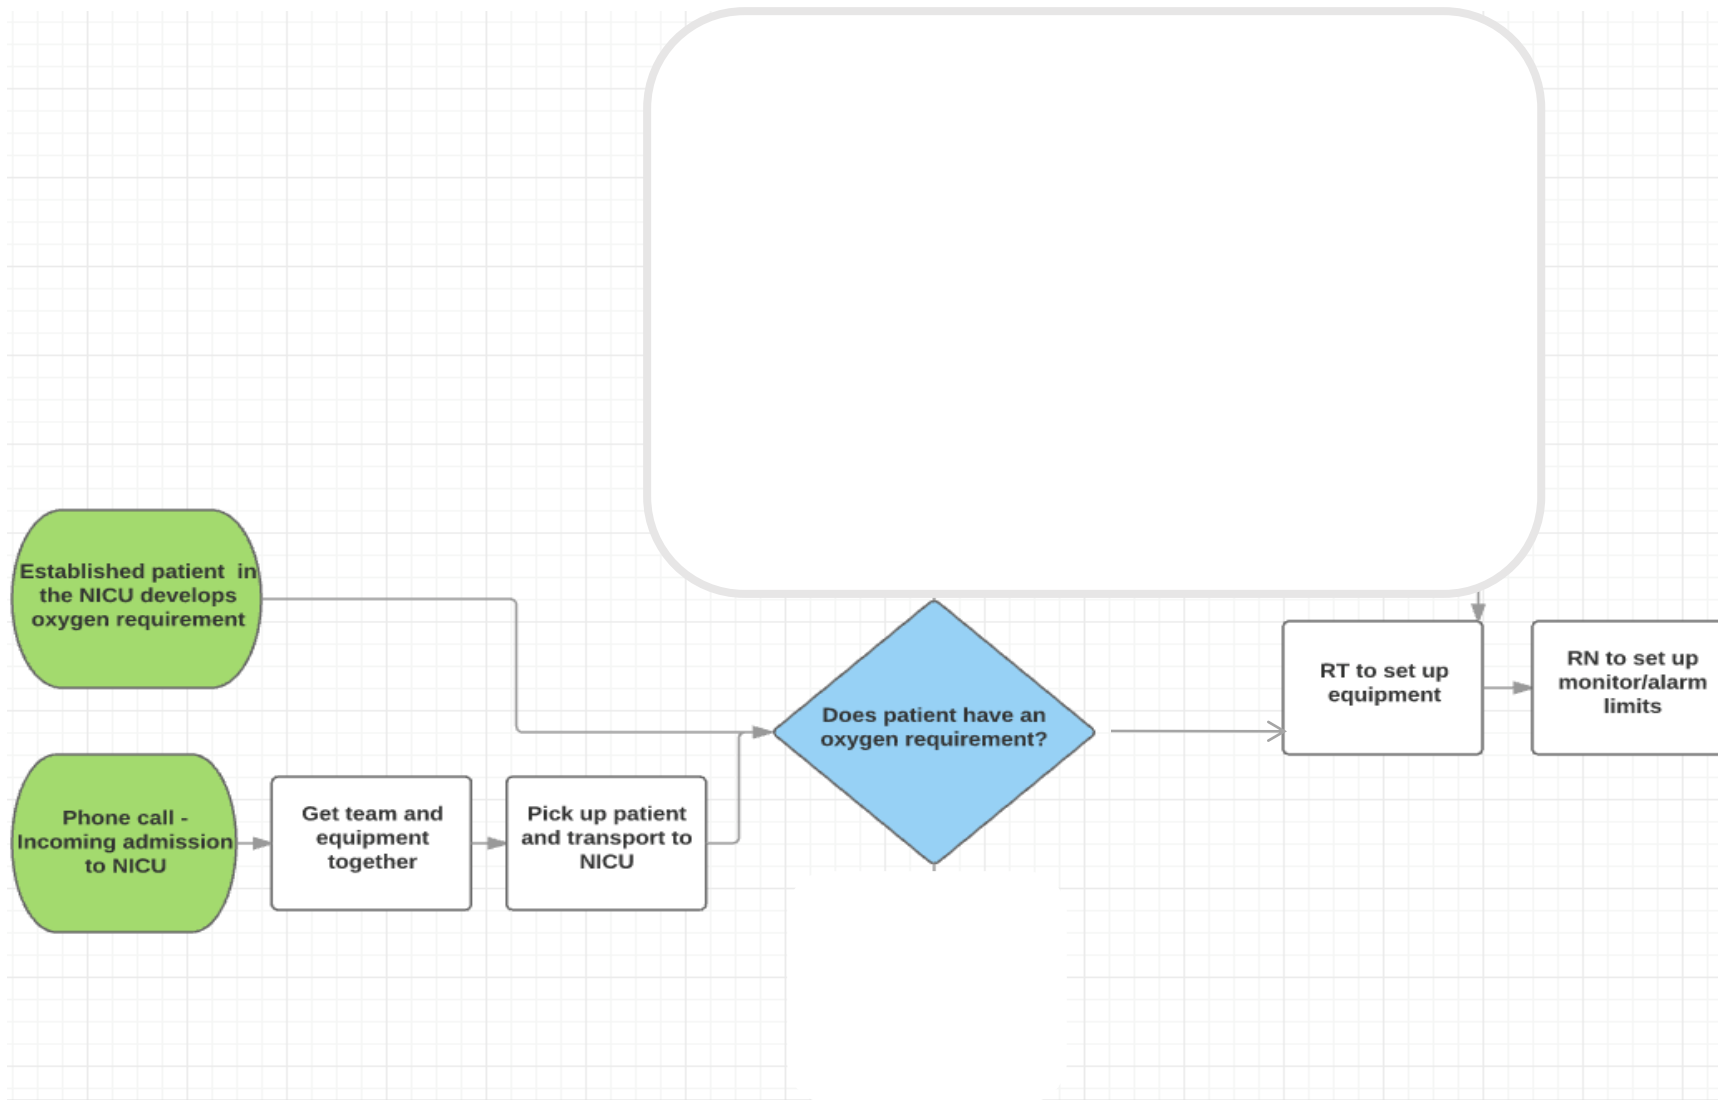

UH VON 2011-2013 ROP statistics

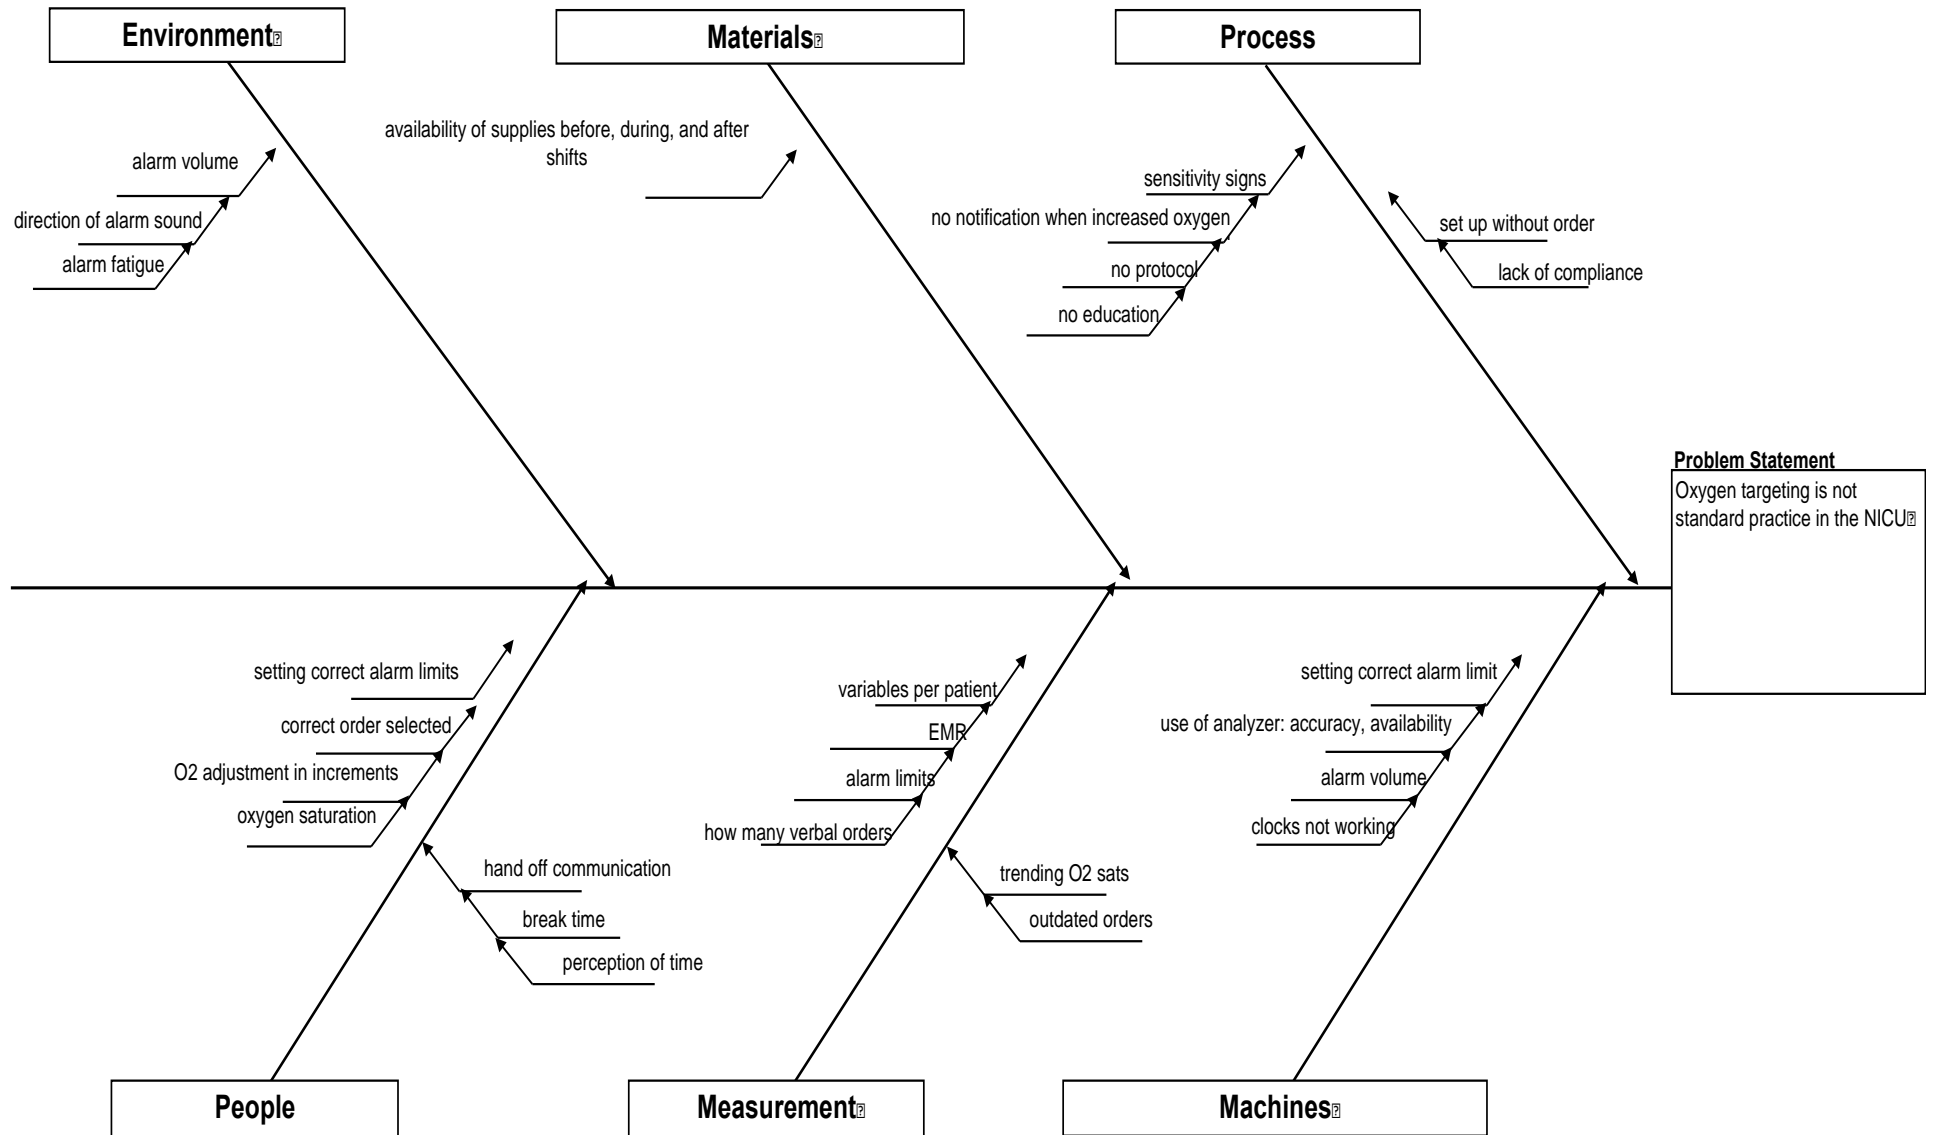

| | UH Rate 2011-2013 | Type C NICU Mean | Type C NICU Q1 | TYPE C NICU Q3 |
|-----------------------|------------------------------|-----------------------------|---------------------------|---------------------------|
| Any ROP- All Eligible | 32.3% | 36.0% | 26.2% | 47.9% |
| Any ROP- Inborn | 28.4% | 33.5% | 22.4% | 45.4 % |
| Surgery- All Eligible | 4.7% | 3.4% | 0.7 | 5.0% |
| Surgery- Inborn | 3.5% | 2.8% | 0 | 4.3% |
| Anti-VEGF Injection | 5.8% | 1.4% | 0 | 2.0% |

Pre-intervention Data

Baseline Order Entered Correct

Pre-intervention Data

Both Alarms Correct

DO: Implementing the Change

3 phases

1. Collect data & develop protocol - September 2015 – Feb 29 2016

Lessons learned:

- No standardized approach to oxygen targeting in place in NICU
- Vast amount of literature and none of it which came to a specific conclusion on what an appropriate target range should be
- Need to limit the data collected only to what applies to protocol

2. Education, oxygen target cards & algorithm at each bedside - March 1-25 2016

Lessons learned:

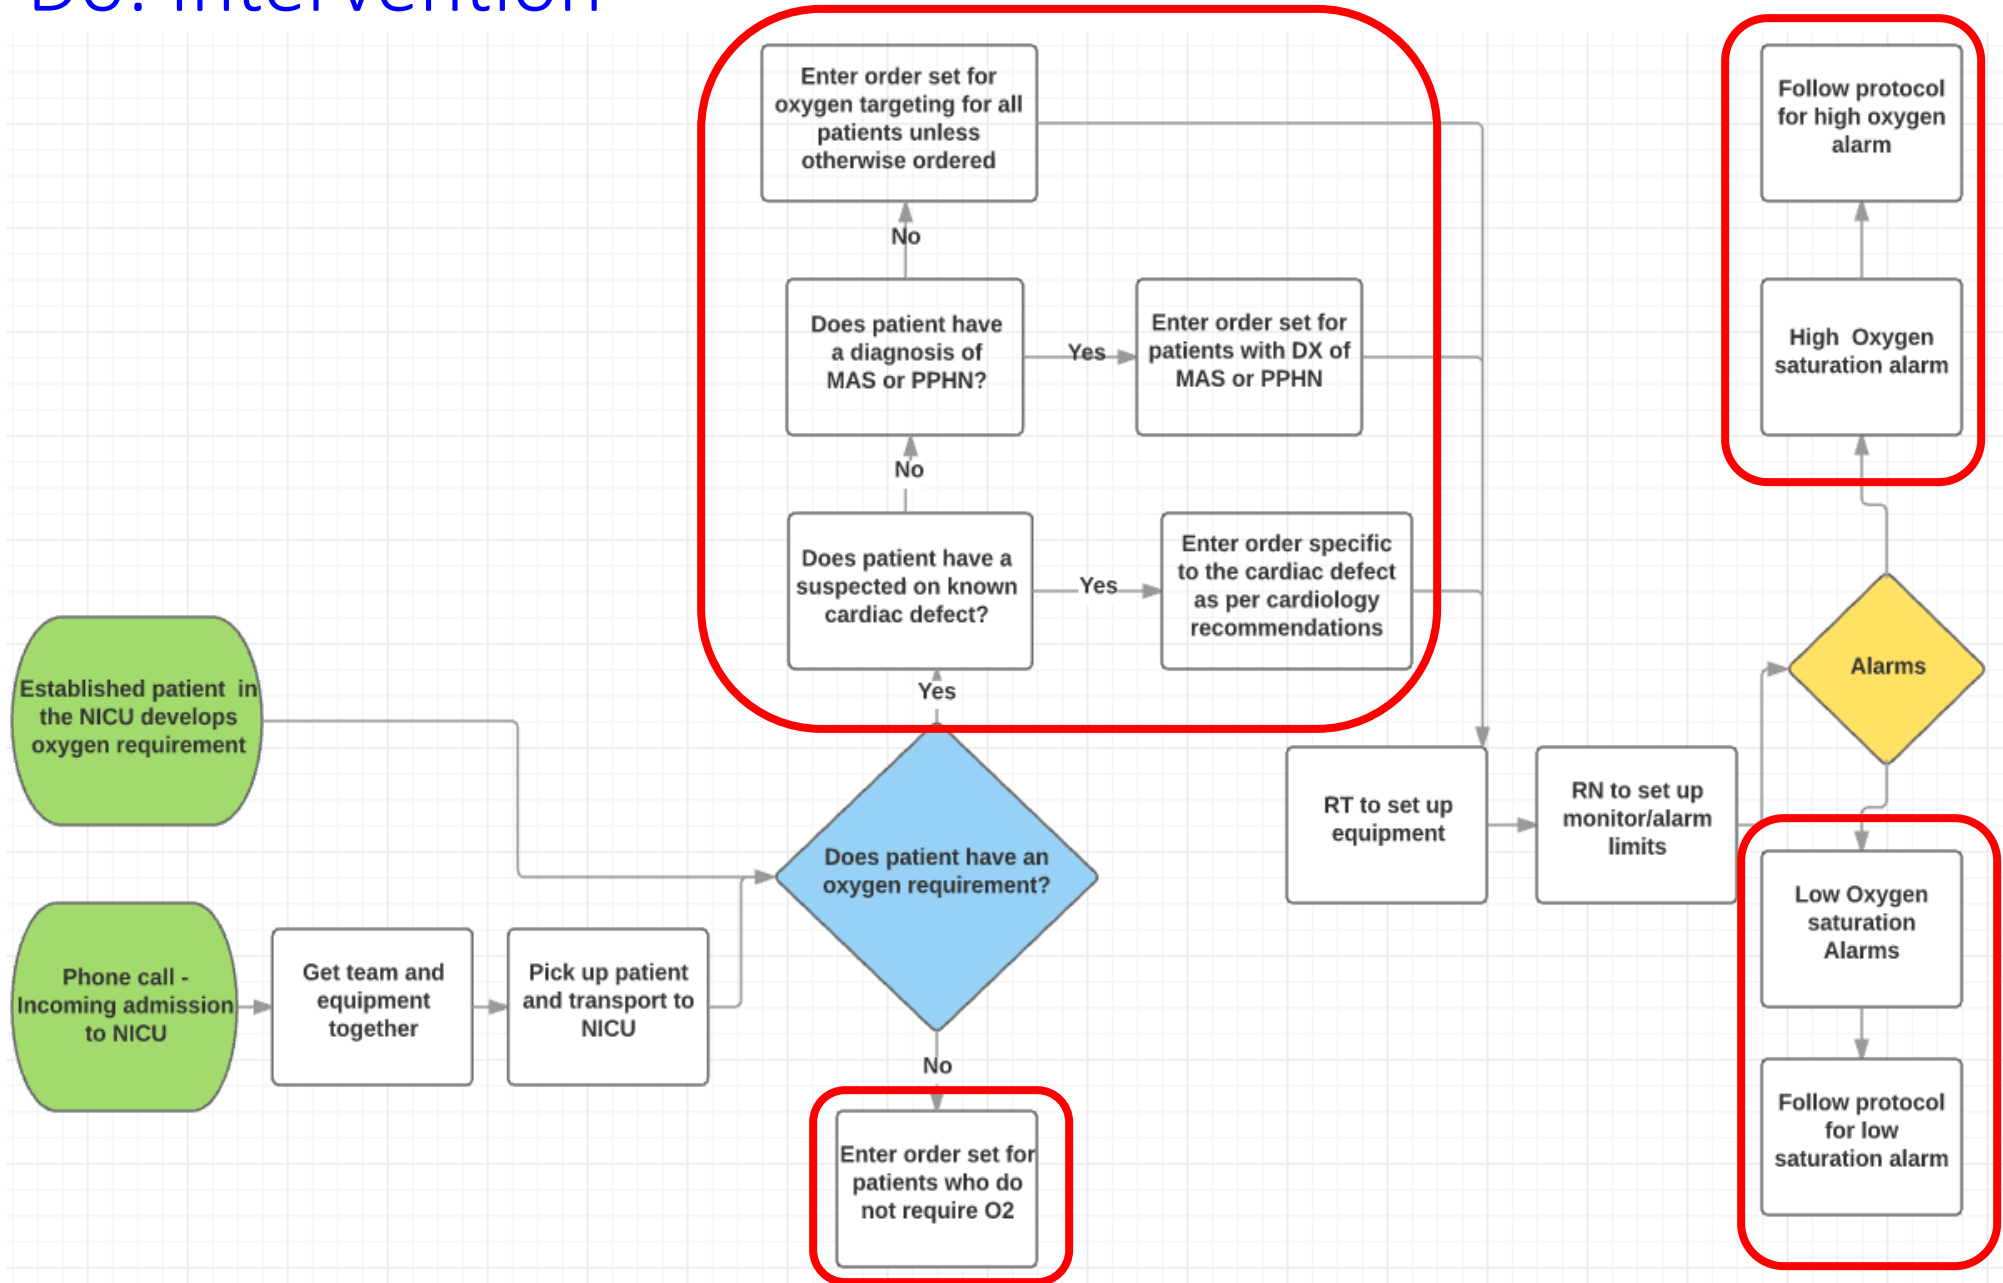

- Over 200 staff members needed to be trained, needed to be concise
- During education period, we learned that it would be beneficial to assess learners knowledge – a pre/post test was developed

3. Quality checks – March 28, 2016 to present

Lessons learned:

- Continuation of long-term data collection needed but will need to modify the team
- May need to decrease the amount of data collected and the interval

Do- Education

Oxygen Targeting Pre & Post Test

1. Hyperoxia plays a big role in which of the following disease processes?
 - A. Retinopathy of Prematurity
 - B. Chronic Lung Disease
 - C. Necrotizing Enterocolitis
 - D. All the above
2. Oxidative Stress is defined as
 - A. An imbalance between production of free radicals and antioxidant defenses.
 - B. Stress related to the implementation of a new oxygen targeting protocol
 - C. An uncharged highly reactive molecule that has unpaired electrons that can cause damage to cells
3. The area of the eye treated with laser therapy in patients with retinopathy of prematurity can eventually have normal function/vision.
True
False
4. The current oxygen saturation alarm limit orders for patients on oxygen who do not have PPHN or a cardiac defect are:
 - A. 88-98
 - B. 85-96
 - C. 85-105
5. A term infant is not at risk for the effects of hyperoxia.
True
False

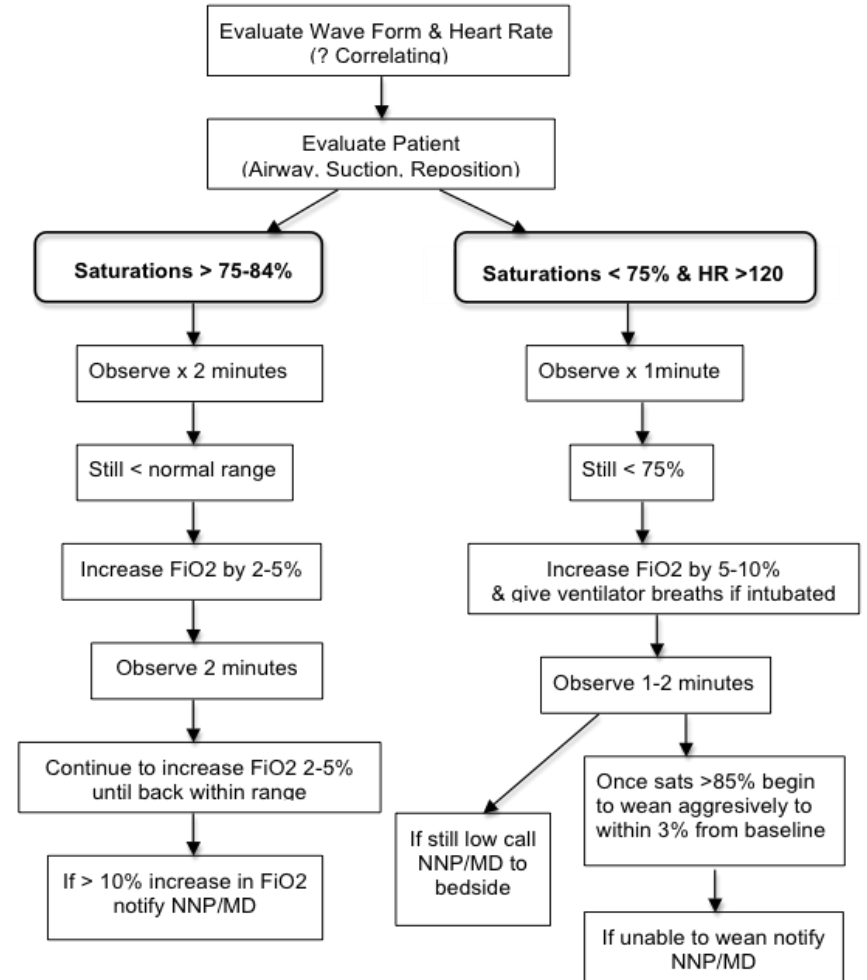

Do – protocol algorithm

High Oxygen Saturation Alarm

Low Oxygen Saturation Alarm

Implementation

Ready...Set...O₂'s

Infant receiving O₂
(unless otherwise ordered)

- Target SpO₂ 88-95%
- Alarm Limits 85-96%

Before YOU go - check my O₂'s!

Ready...Set...O₂'s

MAS/PPHN

- Target SpO₂ > 95%
- Alarm Limits 95-100%

Before YOU go - check my O₂'s!

Ready...Set...O₂'s

Congenital Heart Disease

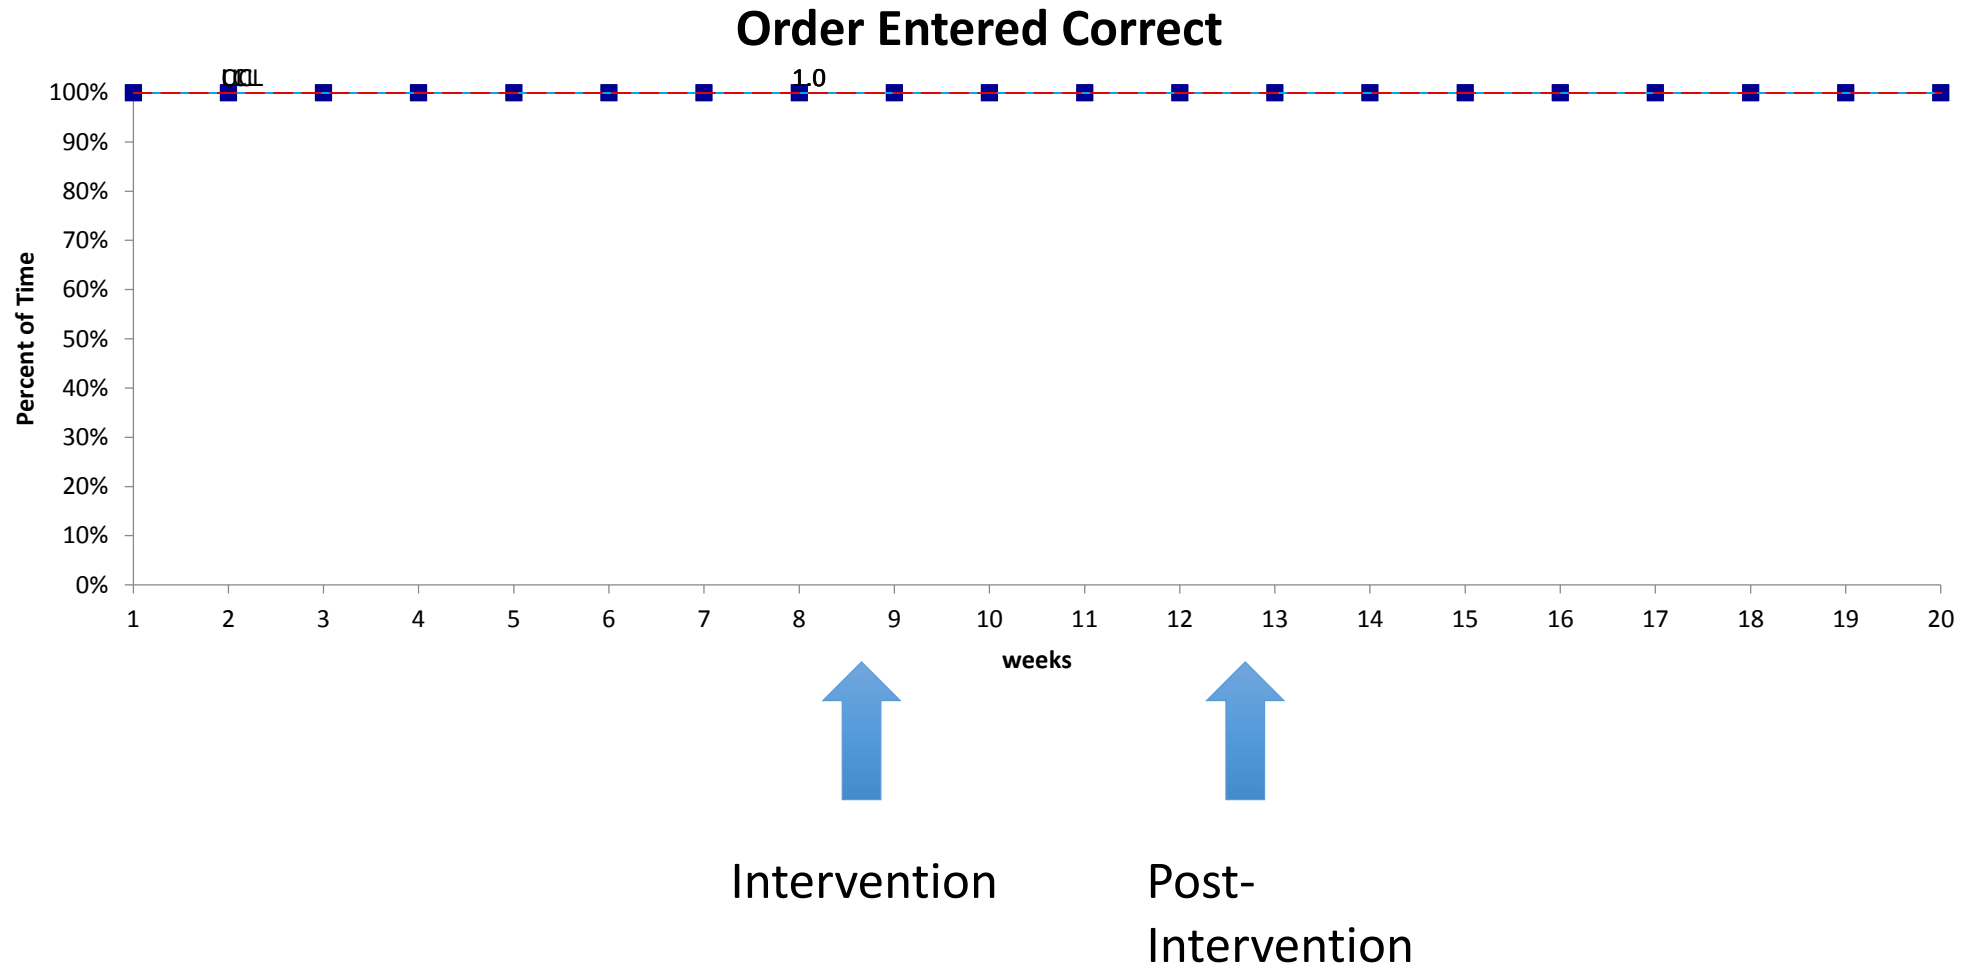

- Target SpO₂ ___ to ___%
- Alarm Limits ___ to ___%

Before YOU go - check my O₂'s!

CHECK: Results/Impact

CHECK: Results/Impact

ACT: Sustaining the Results

Short term audits

- Daily to weekly

Long-term audits

- Quarterly review of patients who require treatment for ROP
- Vermont Oxford Network (data obtained on a yearly basis)

Education

- PRN based on compliance
- Yearly competency for nurses
- Part of new employee orientation to the NICU

Return on Investment

- UHS 2015

7 cases severe ROP that required laser or injection with anti-VEGF

Potential cost of one treatment of laser or anti- VEGF injection = **\$11,500/ case**

Anti VEGF injection = \$3513 for 0.3 mg dose

\$7314 for 0.5mg dose

Facility cost of Laser or injection = \$190

Patient exam = \$100

Cost of one day in NICU bed = \$3900

Potential ROI for prevention of Reactive Oxygen Species (ROS) comorbidities (CLD, IVH,

NEC) = **PRICELESS**

Conclusion/What's Next

Compliance

- Peaked within a few weeks of intervention to ~65%
- 8 weeks post-intervention, at ~ 30%

Barriers to sustaining the results

- Conflicting orders
- alarm fatigue
- Some programming issues with the monitors have been identified

Plan

- Working with IT to modify order set
- Contacting monitor manufacturer to modify alarms
- Continue audits (RT → RNs)
- Relay audit data to nursing staff at daily huddles
- Graphs showing compliance to be placed on LEAN board in unit
- One on one counseling with staff who is not compliant

Team Picture

Thank you!
